

# Nuclear Astrophysics Measurements with Radioactive Beams

**Michael Smith**  
Physics Division  
Oak Ridge National Laboratory  
Oak Ridge, Tennessee, USA  
October 31, 2019

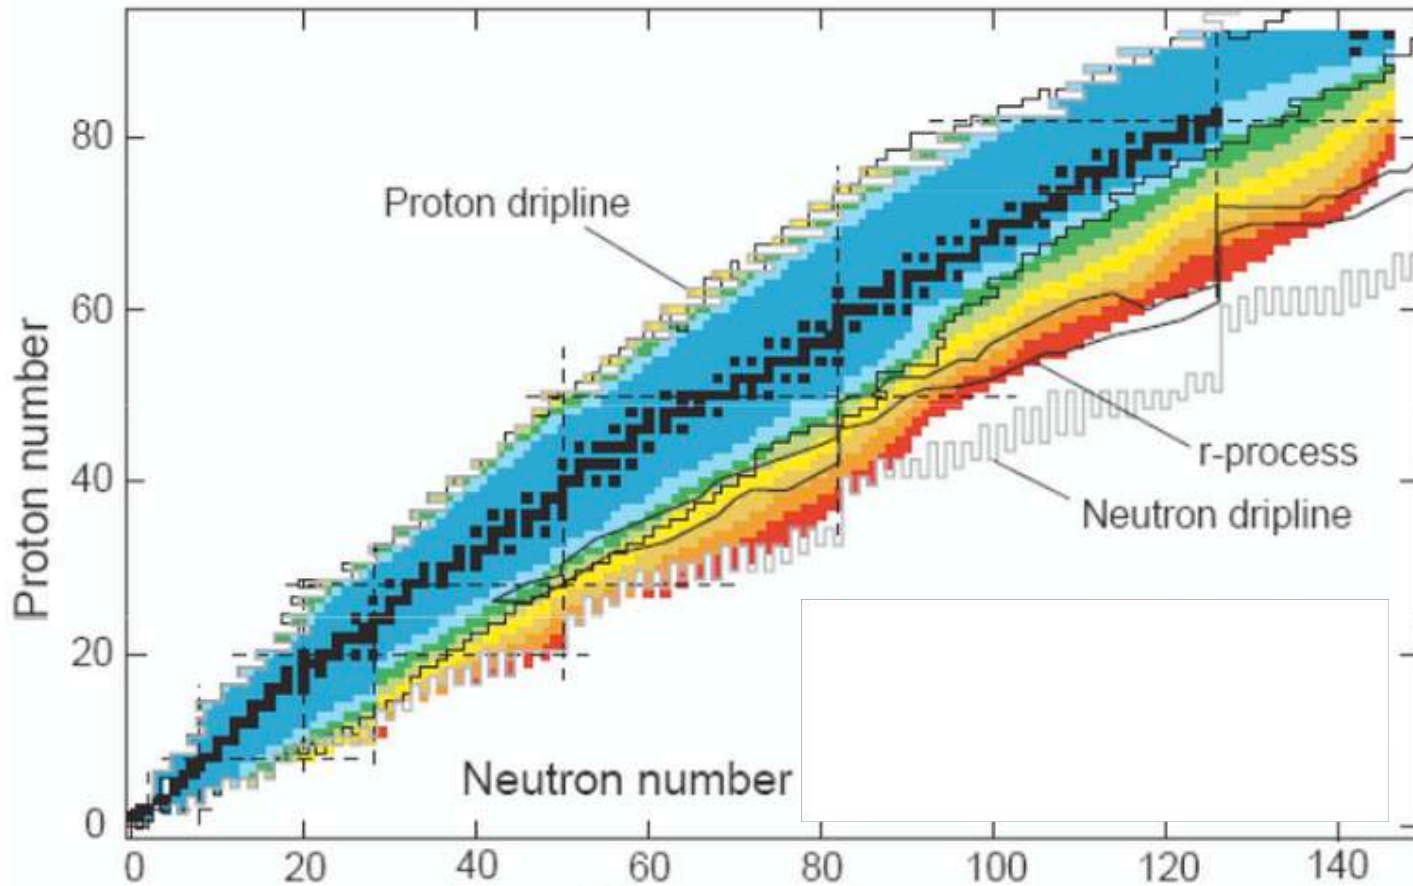

ORNL is managed by UT-Battelle, LLC for the US Department of Energy

# Promise of Radioactive Beams

- radioactive beam facilities enable nuclear scientists to study some of the most fascinating phenomena in nature

## Promise of Radioactive Beams

- *find limits of nuclear stability & determine structure of “extreme” nuclei*

## Promise of Radioactive Beams

halo nucleus

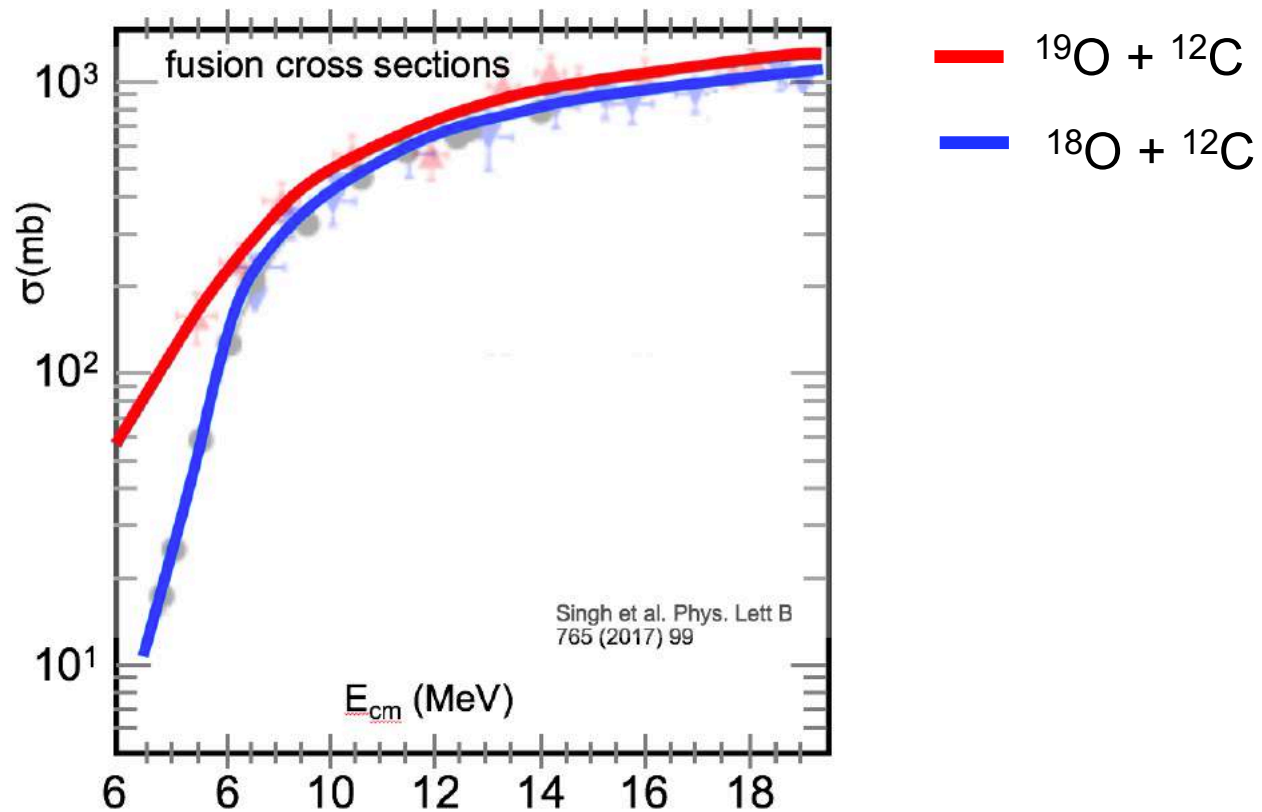

$^{48}\text{Ca}$  neutron skin

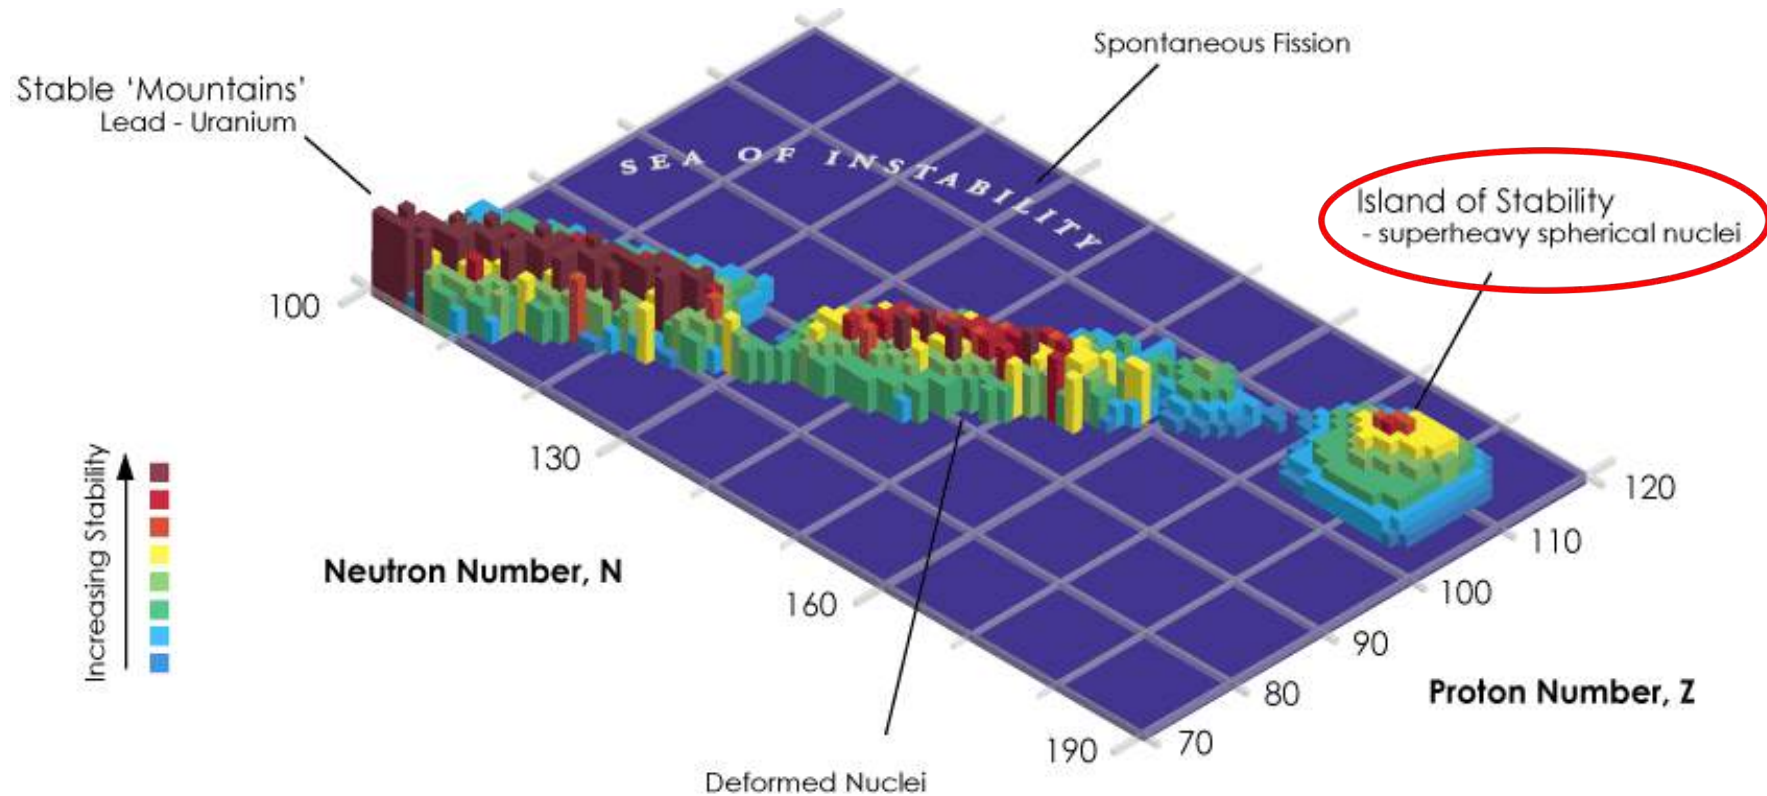

- use this information to determine predictive models of subatomic nuclei

## Promise of Radioactive Beams

- *improve our understanding of nuclear reactions*

# Promise of Radioactive Beams

- *discover a new pathway to synthesize superheavy nuclei*

## *Promise of Radioactive Beams*

- *produce new isotopes for imaging and treating cancer*

## *Promise of Radioactive Beams*

- *help improve international nuclear security*

# Promise of Radioactive Beams

- provide an **empirical foundation** for understanding **exploding stars**

## Unstable Nuclei are Crucial in Explosions

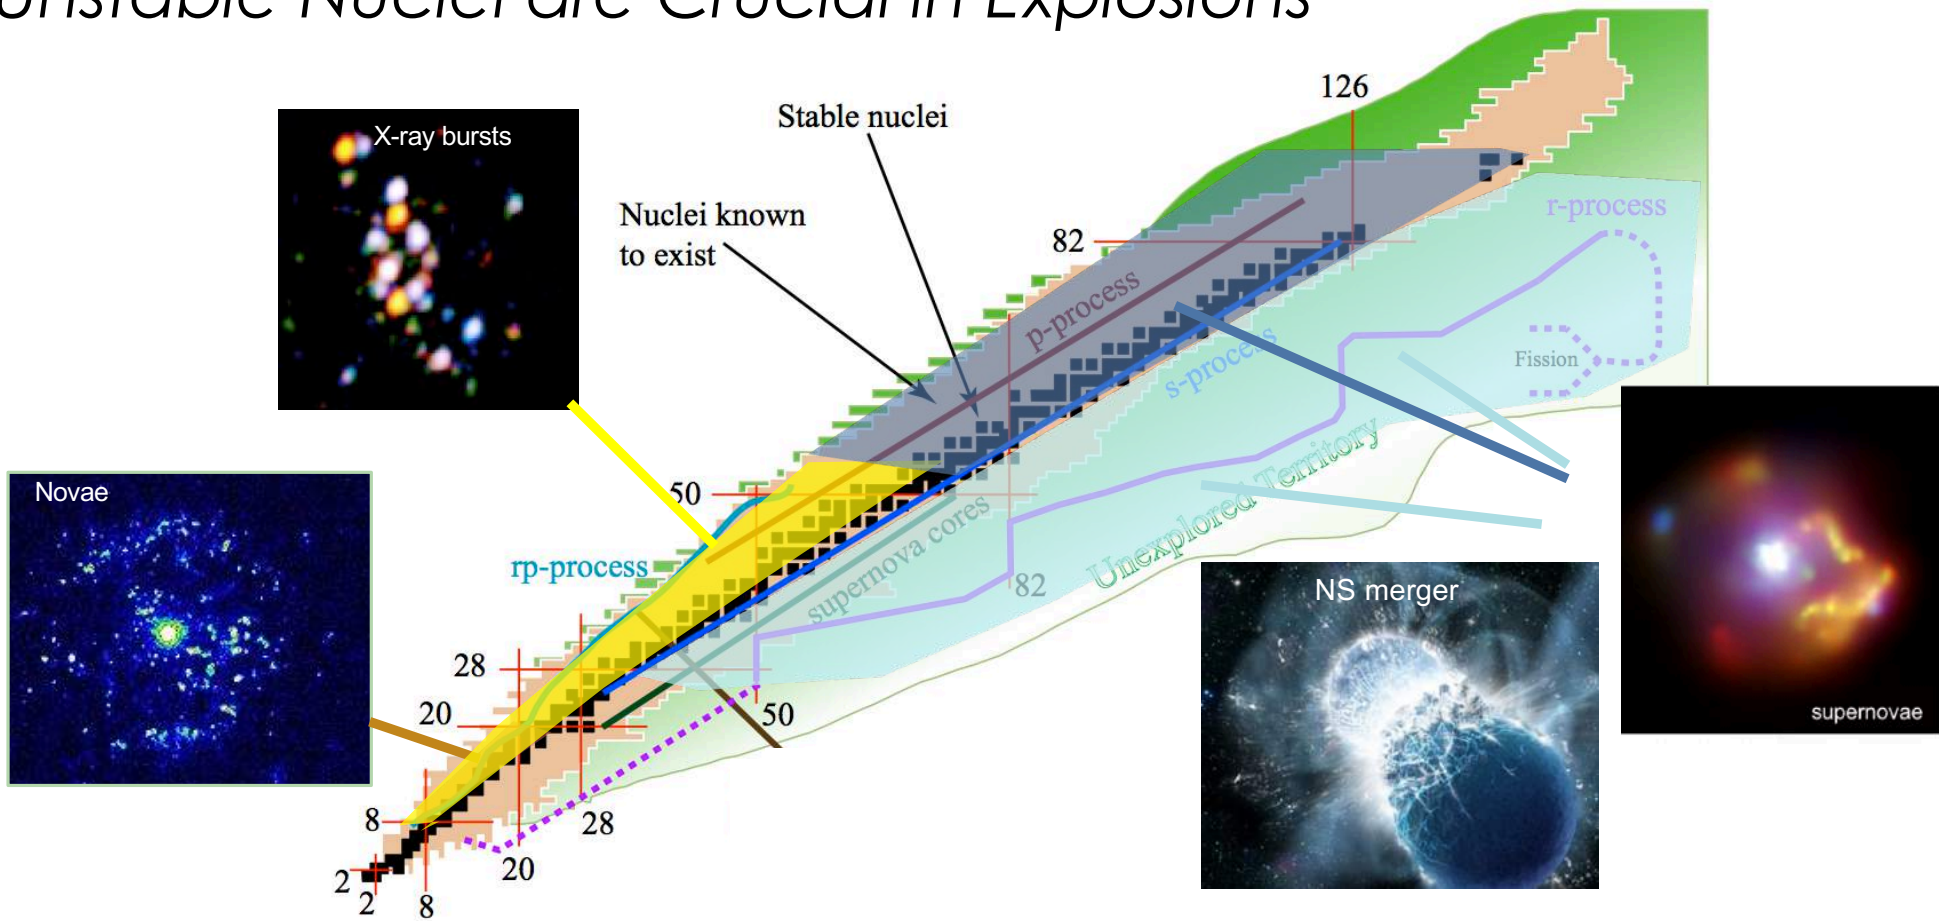

- in exploding stars, extreme temperatures & densities cause unstable nuclei to be formed and have **subsequent reactions before decay**

# Unstable Nuclei are Crucial in Explosions

- **sequences** of reactions on **unstable isotopes** occur in explosions

# Unstable Nuclei are Crucial in Explosions

- *these reaction sequences play a critical role in element creation*

# Unstable Nuclei are Crucial in Explosions

- radioactive beam facilities **enable measurements** that form an **empirical foundation** for our understanding of stellar explosions

## Science Goals in Nuclear Astrophysics with Unstable Beams

X-ray burst animation

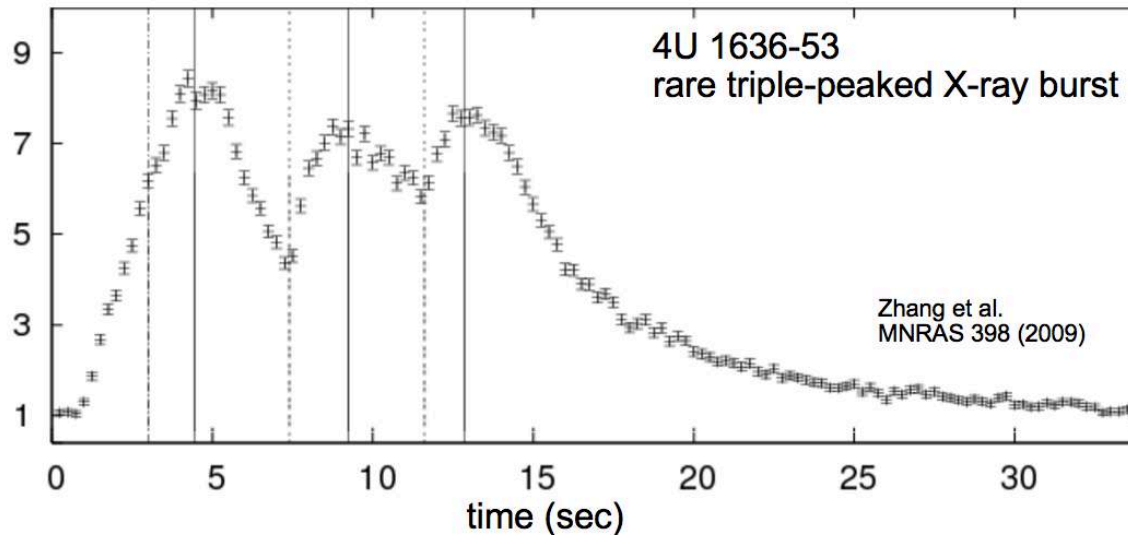

Core collapse supernova animation

- *understand the energy generation and element creation in stellar explosions*

# Science Goals in Nuclear Astrophysics with Unstable Beams

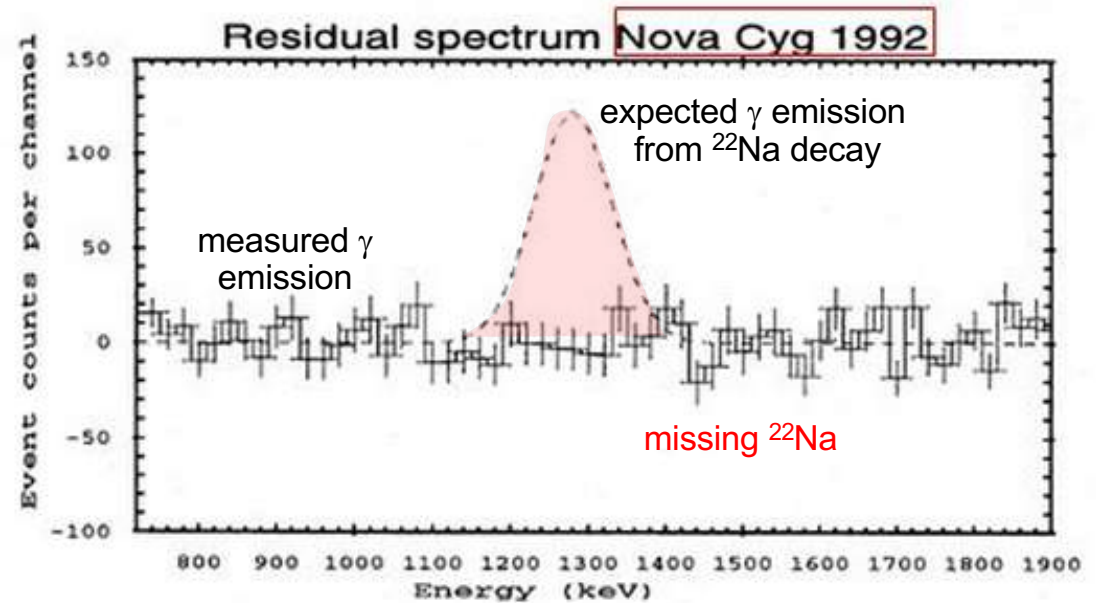

1.8 MeV Gamma Radiation in Galaxy

- *understand the energy generation and element creation in stellar explosions*
- *help decipher explosion observables*

# Science Goals in Nuclear Astrophysics with Unstable Beams

- *understand the energy generation and element creation in stellar explosions*
- *help decipher explosion observables*
- *address important unanswered puzzles about exotic cosmic events*

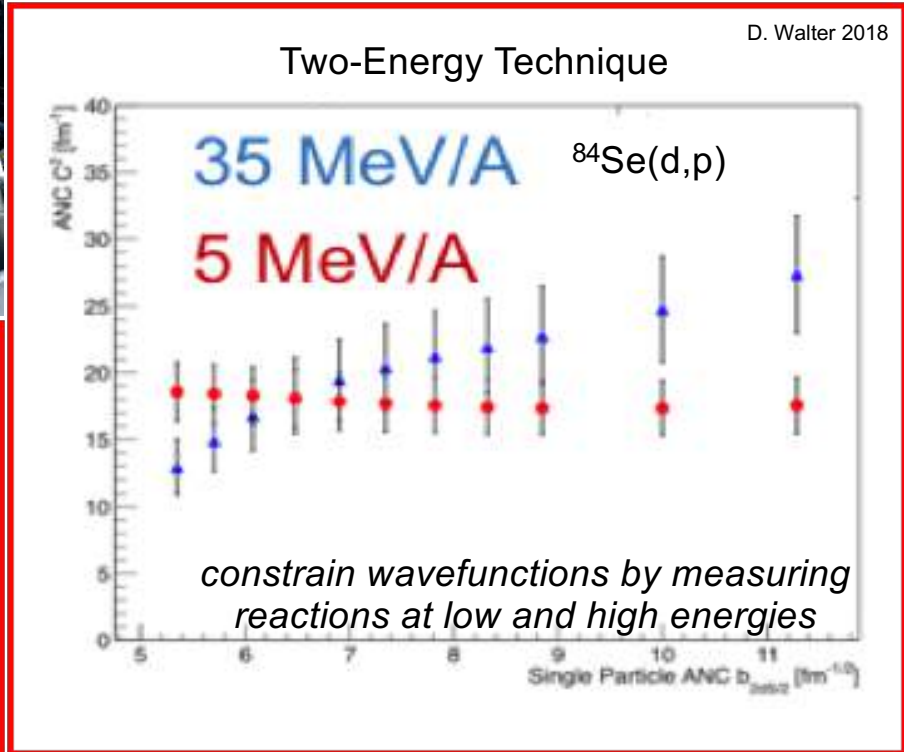

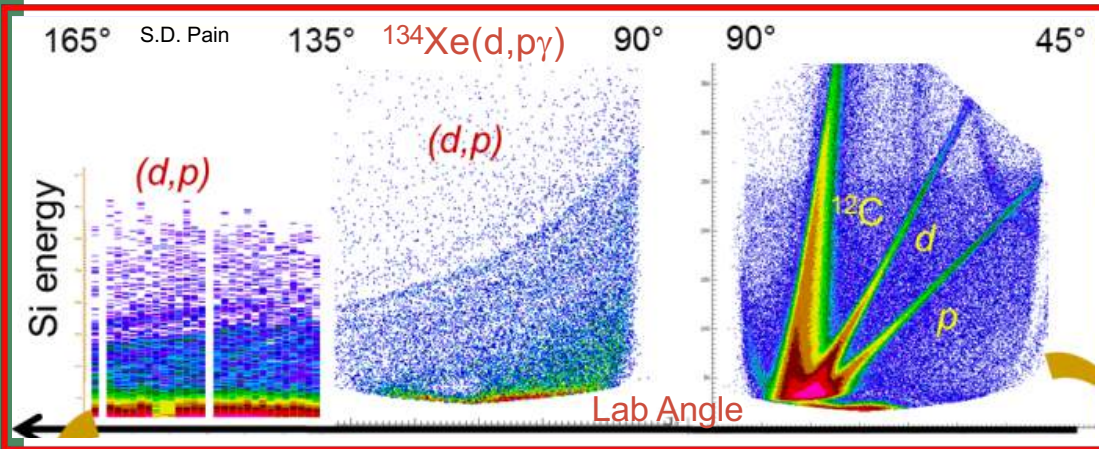

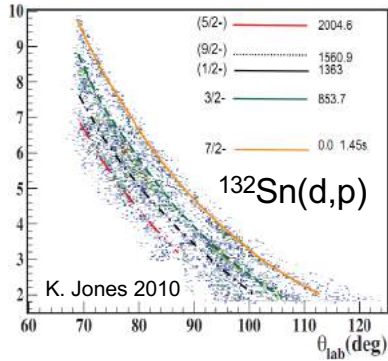

# Science Goals in Nuclear Astrophysics with Unstable Beams

- *understand the energy generation and element creation in stellar explosions*
- *help decipher explosion observables*
- *address important unanswered puzzles about exotic cosmic events*
- *probe the chemical evolution of the galaxy*

# Overall Approach

- closely couple **radioactive beam measurements** with the **development** of advanced **detectors & techniques** needed to make these measurements

# Outline

- Astrophysical Sites & Open Questions
- Experimental Approaches
- Challenges
- Recent Highlights
- Future Plans

Nuclear Astrophysics with Radioactive Beams

National Laboratory

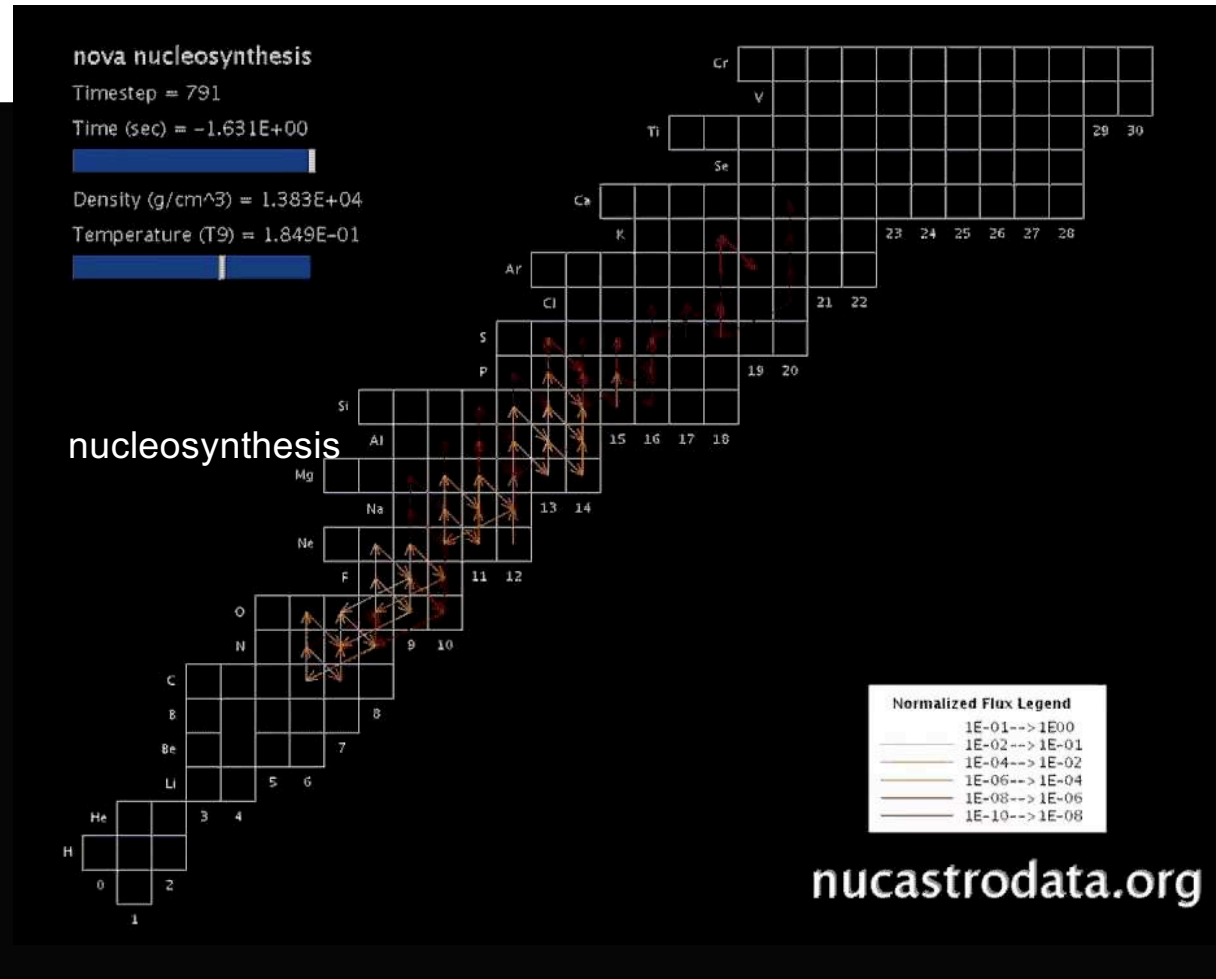

# Nova Explosions

artist conception

observation

- *thermonuclear outburst on the surface of an accreting white dwarf star*

# Nova Explosions – Open Questions

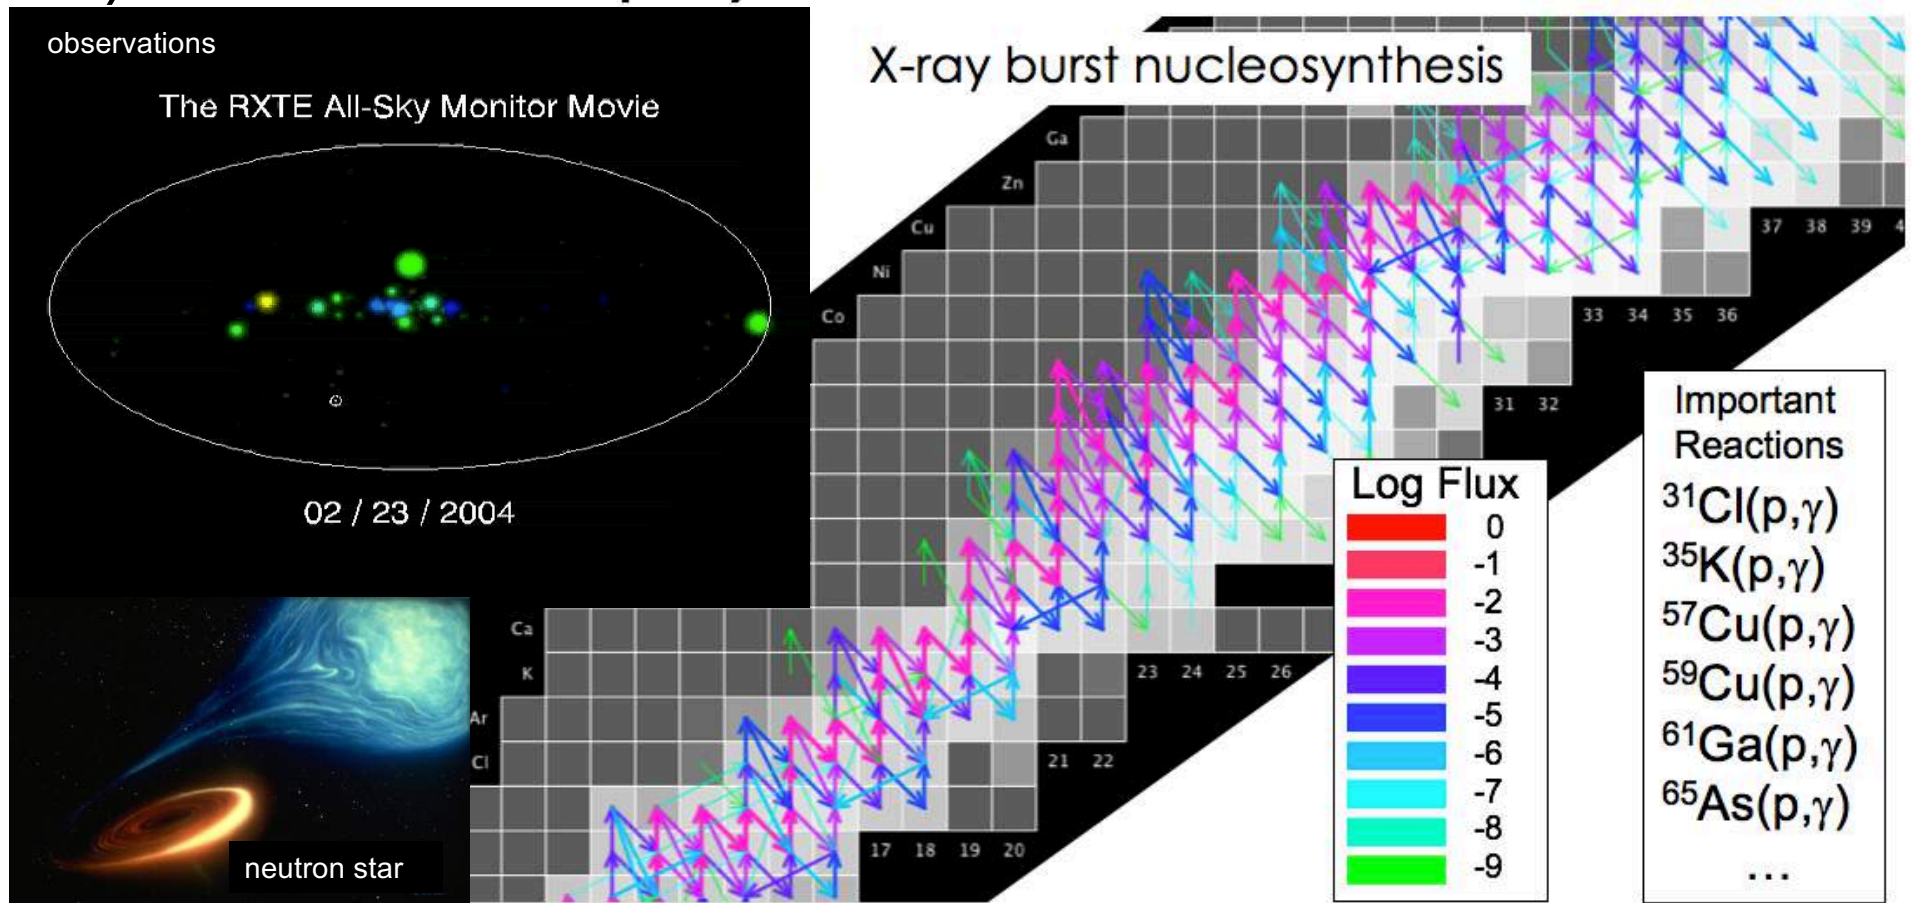

- explain nova observables from meteorites & satellites
- what triggers the outburst?
  - Mixing of WD material with accreted layer?
- highest peak temperatures?
  - Possible new class of high-temperature novae
  - Isotopic ratios that are “thermometers”
- heaviest masses synthesized?

Active Beams

# X-ray Bursts

- *thermonuclear outburst on the surface of an accreting neutron star*

# X-ray Bursts – Open Questions

Quantitative model comparison with observations

- radius expansion bursts and possible **ejection** of material
- short recurrence time bursts, double peaking, precursor bursts?
- **termination** via hydrogen exhaustion or cooling expansion?
- highest masses synthesized and peak temperatures?
- ash composition & influence on **neutron star evolution**

XRB ashes

Nucle

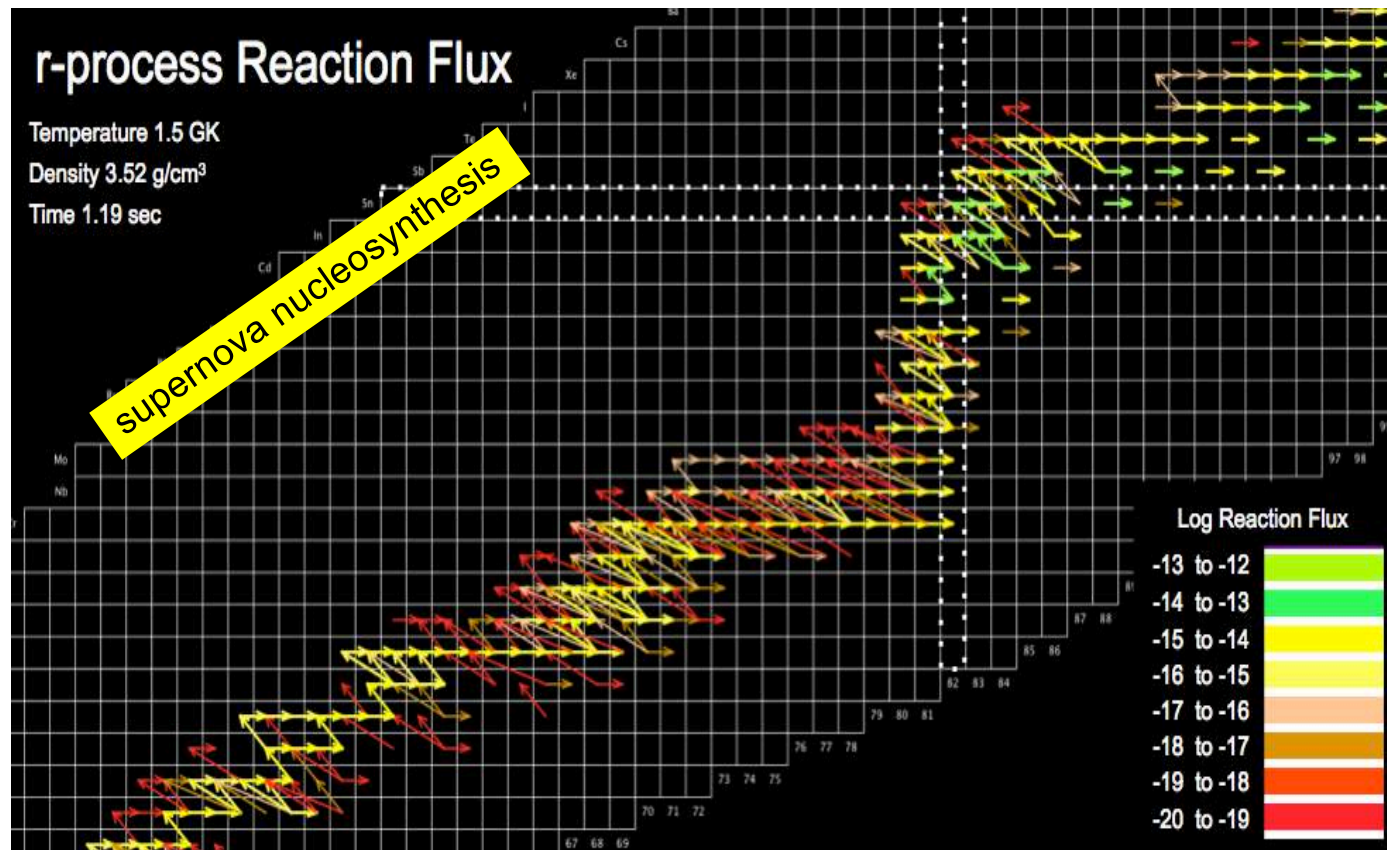

# Core Collapse Supernovae

- *collapse of a massive star forming a neutron star or black hole*

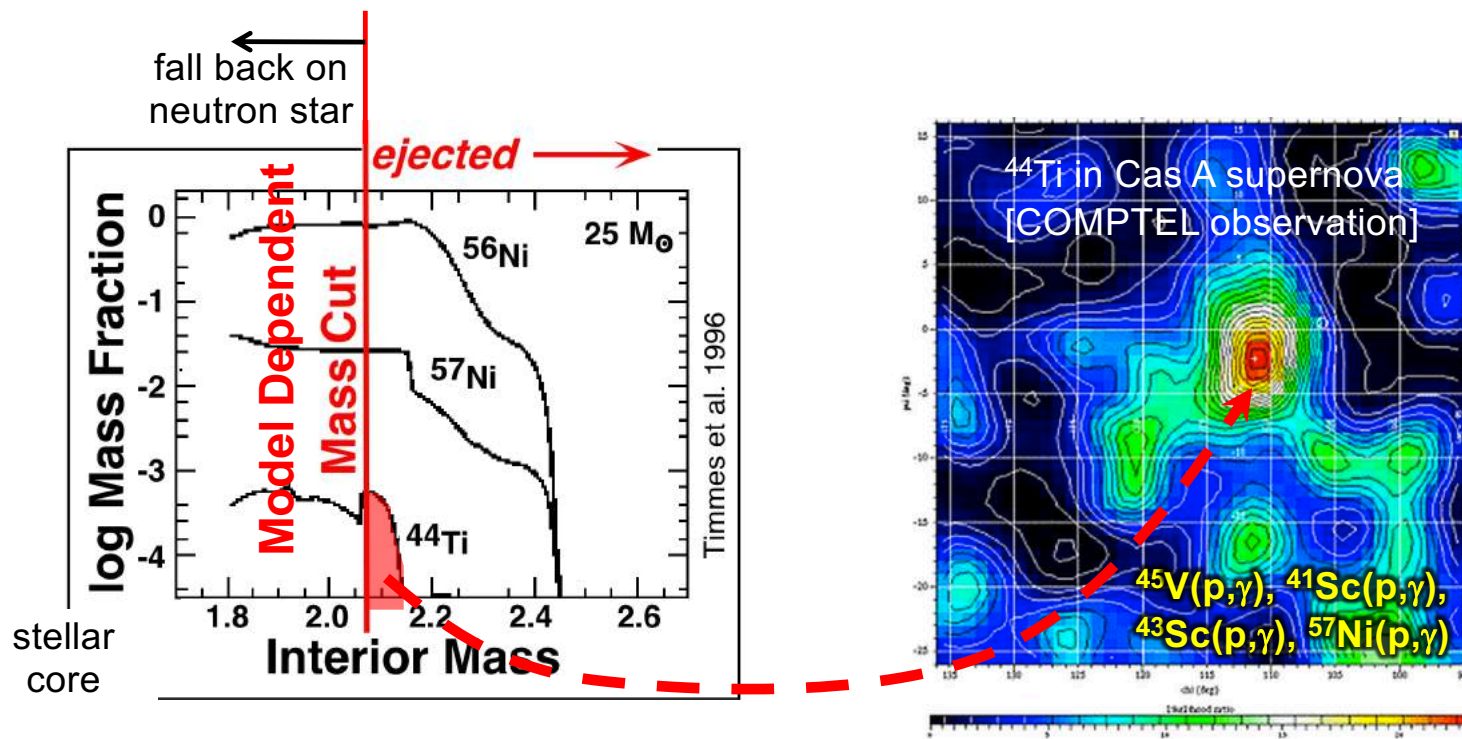

# Core Collapse Supernovae – Open Questions

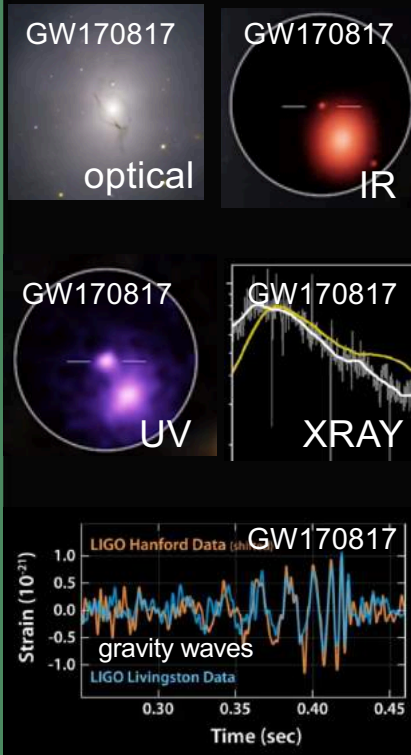

- what fraction of the elements heavier than iron are synthesized in supernovae?

# Core Collapse Supernovae – Open Questions

- production of radionuclides  $^{44}\text{Ti}$ ,  $^{26}\text{Al}$ , others influenced by  $(p,\gamma)$  rates
- location of “mass cut” can be constrained with help of better rates

# Neutron Star Mergers

The stars get closer, and faster...

- merger of 2 neutron stars forming a kilonova

# Neutron Star Mergers – Open Questions

- can we understand the nucleosynthesis in the kilonova?
- can we predict robust observational signatures of NSMs?
- what percentage of *r*-process material is formed in mergers?

## Other Exotic Systems

- *these exotic systems feature unusual thermonuclear burning*

# Experimental Approaches

Annu. Rev. Nucl. Part. Sci. 2001. 51:91–130

## NUCLEAR ASTROPHYSICS MEASUREMENTS WITH RADIOACTIVE BEAMS\*

Michael S. Smith<sup>1</sup> and K. Ernst Rehm<sup>2</sup>

### CONTENTS

1. INTRODUCTION	.....
2. MOTIVATION AND BACKGROUND	.....
2.1. Nuclear Physics Information for Astrophysical Modeling	..
2.2. Unstable Nuclei in Astrophysical Environments	.....
2.3. The Need for Radioactive Beams	.....
3. RADIOACTIVE BEAM PRODUCTION TECHNIQUES	.....
3.1. Isotope Separator On-Line (ISOL) Production	.....
3.2. Projectile Fragmentation Production	.....
3.3. In-Flight Production	.....
3.4. Batch Mode Production	.....
4. DIRECT EXPERIMENTAL APPROACHES AND ASSOCIATED EQUIPMENT	.....
4.1. General Description and Required Intensities	.....
4.2. Targets	.....
4.3. Radiative Capture Reactions	.....
4.4. Transfer Reactions	.....

5. INDIRECT EXPERIMENTAL APPROACHES AND ASSOCIATED EQUIPMENT	.....
5.1. General Description	.....
5.2. Scattering Reactions	.....
5.3. Transfer Reactions	.....
5.4. Time-Inverse Reactions	.....
5.5. Mass and Lifetime Measurements	.....
6. EXPERIMENTAL RESULTS AND ASTROPHYSICAL IMPLICATIONS	.....
6.1. The ${}^7\text{Be}(p,\gamma){}^8\text{B}$ Reaction	.....
6.2. The ${}^8\text{Li}(\alpha,n){}^{11}\text{B}$ Reaction	.....
6.3. The ${}^{11}\text{C}(p,\gamma){}^{12}\text{N}$ Reaction	.....
6.4. The ${}^{13}\text{N}(p,\gamma){}^{14}\text{O}$ Reaction	.....
6.5. The ${}^{14}\text{O}(\alpha,p){}^{17}\text{F}$ Reaction	.....
6.6. The ${}^{15}\text{O}(\alpha,\gamma){}^{19}\text{Ne}$ Reaction	.....
6.7. The ${}^{17}\text{F}(p,\gamma){}^{18}\text{Ne}$ Reaction	.....
6.8. The ${}^{18}\text{F}(p,\alpha){}^{15}\text{O}$ and ${}^{18}\text{F}(p,\gamma){}^{19}\text{Ne}$ Reactions	.....
6.9. The ${}^{18}\text{Ne}(\alpha,p){}^{21}\text{Na}$ Reaction	.....
6.10. The ${}^{19}\text{Ne}(p,\gamma){}^{20}\text{Na}$ Reaction	.....
6.11. The ${}^{44}\text{Ti}(\alpha,p){}^{47}\text{V}$ Reaction	.....
6.12. The ${}^{56}\text{Ni}(p,\gamma){}^{57}\text{Cu}$ Reaction	.....
6.13. Mass and Lifetime Measurements for Explosive Nucleosynthesis	.....
6.14. Crucial Measurements for the Future	.....
7. FUTURE RADIOACTIVE BEAM FACILITIES	.....
7.1. Future ISOL Facilities	.....
7.2. Future Fragmentation Facilities	.....
7.3. The Rare Isotope Accelerator	.....
7.4. Other Planned Radioactive Beam Facilities	.....
8. OUTLOOK	.....

## Experimental Approaches – Inverse Kinematics

- cannot make a target out of the heavy radioactive nuclei
- measurements therefore utilize an **inverse kinematics** approach – radioactive **heavy beam bombarding a light target**

challenging!

# Experimental Approaches

- *direct studies* – measure reaction in lab that occurs in star
- *indirect studies* – measure different reaction for relevant structure / reaction information

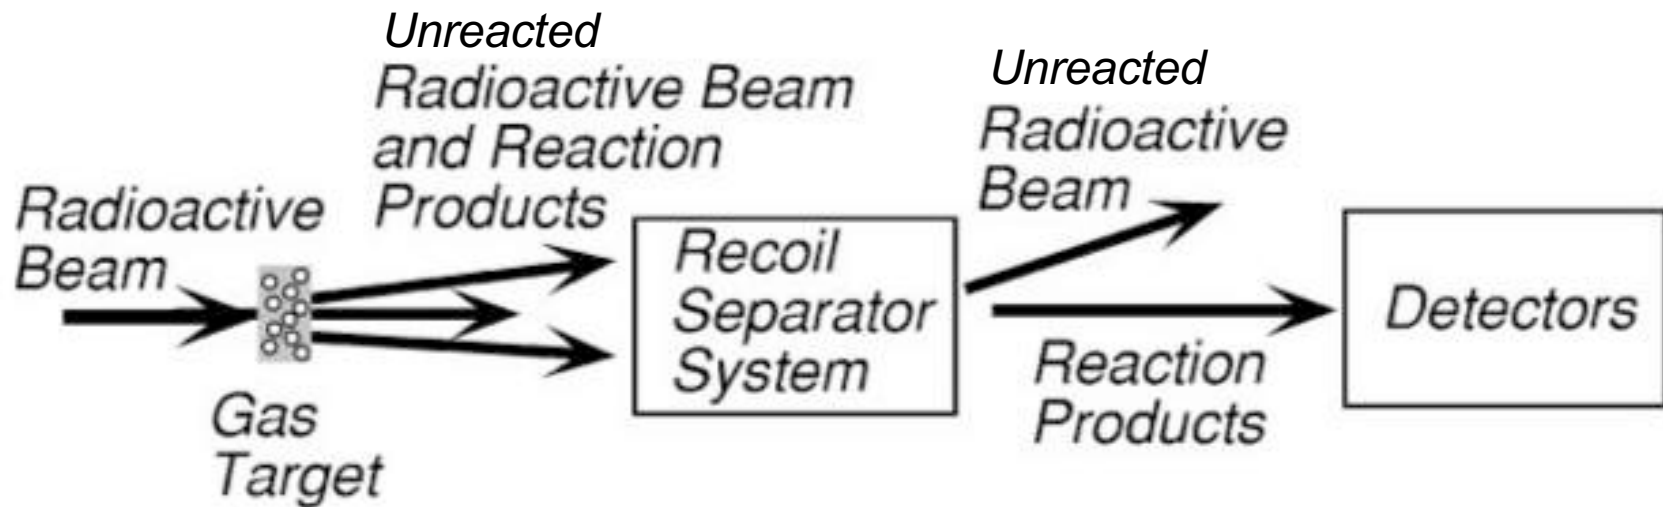

# Experimental Approaches

	Direct Studies	Indirect Studies
<i>beam</i>	one choice	multiple choices
<i>equipment</i>	few choices / expensive	wide variety of types/cost
<i>yields</i>	very low (~ event/day)	~10 <sup>5</sup> times higher
<i>results</i>	low ambiguity	higher ambiguity
<i>data analysis</i>	relatively straightforward	can be very complex

## Direct Measurements – capture reactions

- recoil separator is positioned along the beam axis
- its purpose is to **separate** all **unreacted beam particles** from fusion reaction products that are  $10^{10} - 10^{17}$  times less intense
- usually employs a combination of components that deflect charged particles (dipole magnet, velocity filter, electrostatic deflectors ...)

# Direct Measurements – capture reactions

Nuclear Instruments and Methods in Physics Research A306 (1991) 233–239  
North-Holland

A recoil separator for use in radioactive ion beam experiments \*

M.S. Smith, C. Rolfs<sup>1</sup> and C.A. Barnes

W.K. Kellogg Radiation Laboratory, California Institute of Technology, Pasadena CA 91125, USA

SECAR at FRIB

KOBRA

DRS

DRAGON

St. George

ARES

ERNA

- approach pioneered in 1991
- now popular approach at numerous labs
- SECAR system at FRIB under construction / commissioning
- KOBRA at RAON has promise for these measurements

# Yield Determinations

Yield (counts/sec) =

$$I \left( \frac{\text{beam particles}}{\text{sec}} \right) \cdot N_t \left( \frac{\text{target particles}}{\text{cm}^2} \right) \cdot$$

↙ beam current
↙ target density

$$\frac{d\sigma}{d\Omega} \left( \frac{\text{cm}^2}{\text{sr}} \frac{\text{reactant particle}}{\text{beam particle target particle}} \right) \cdot \Delta\Omega \text{ (sr)} \cdot \epsilon \left( \frac{\text{counts}}{\text{reactant particle}} \right)$$

↙ cross section
↙ solid angle
↙ detector efficiency

# Yield Determinations

Typical example...

$$I \sim 10^7 \frac{\text{beam particles}}{\text{sec}}$$

excellent current for an unstable beam!

$$N_t \sim 10^{18} \frac{\text{target particles}}{\text{cm}^2}$$

gas jet target

$$\frac{d\sigma}{d\Omega} \sim 10^{-29} \frac{\text{cm}^2}{4\pi \text{ sr}} \frac{\text{reactant particle}}{\text{beam particle target particle}}$$

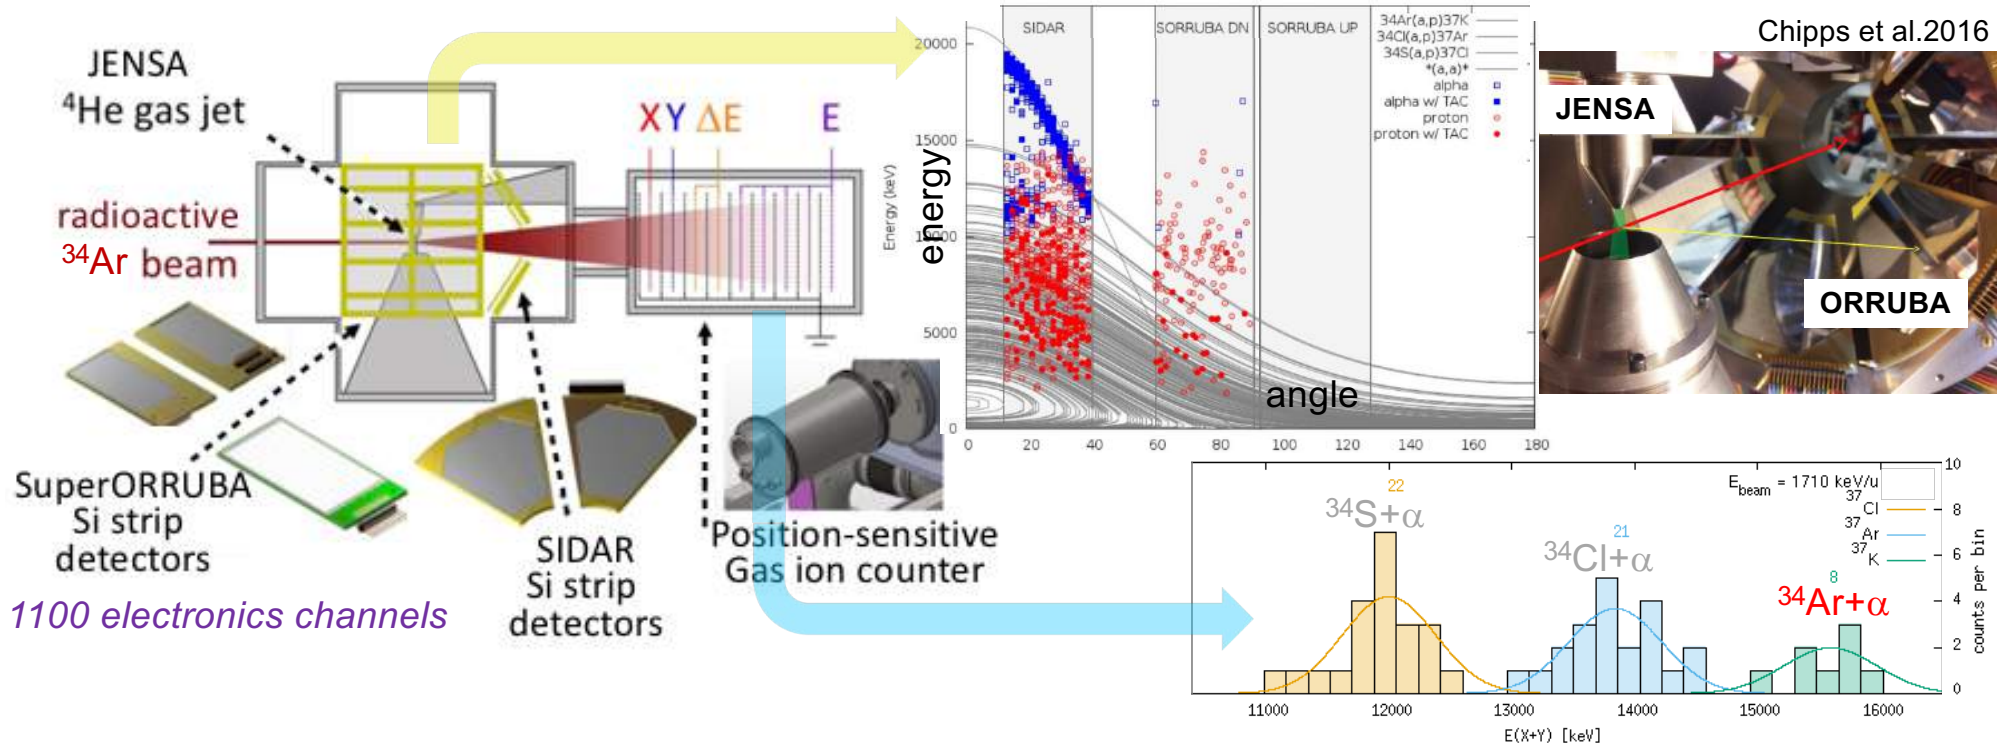

10  $\mu\text{b}$  is typical

$$\Delta\Omega \sim 0.1 \cdot 4\pi \text{ sr}$$

$$\varepsilon \sim 0.8 \frac{\text{counts}}{\text{reactant particle}}$$

Yield  $\sim 0.8 \cdot 10^{-5}$  reactant particles/sec  
 $\sim 0.7$  reactant particles/day

# Direct Measurements – other reactions

Chippis et al. 2016

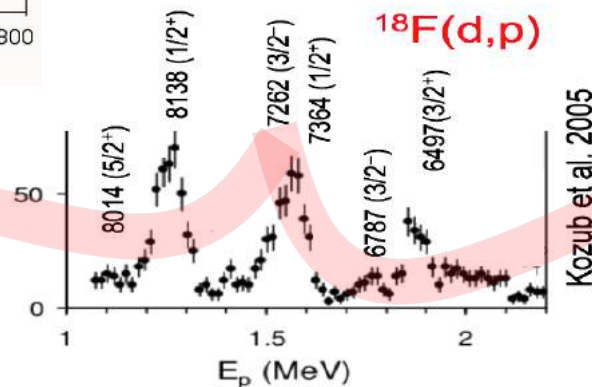

- $(p, \alpha)$  and  $(\alpha, p)$  reactions are often measured directly with Si strip detectors

## Indirect Approaches

- $(p,p)$  to locate resonances
- $(p,p')$  for branching ratios
- $(d,n)$ ,  $({}^3\text{He},d)$ ,  $(\alpha,t)$  to simulate  $(p,\gamma)$
- **$(d,p)$  to simulate  $(n,\gamma)$**   $\longrightarrow$
- surrogate reactions
- Trojan horse methods
- inverse reactions for ground state transitions
- Coulomb dissociation  $(\gamma,p)$
- multinucleon transfer for structure info (mass, lifetimes, decay branches, level densities, beta-delayed particle emission...)

# Combined Approach

- first measure scattering to locate resonances [beam  $\sim 10^3$  pps]
- follow up with transfer to measure spectroscopic factors [ $\sim 10^4 - 10^5$  pps]
- finish with direct measurements on strongest resonances [ $\sim 10^5 - 10^7$  pps]

# Equipment

- recoil separators for capture measurements
- gas targets for capture and  $(p, \alpha), (\alpha, p)$
- Si strip arrays for charged-particle detection
- gamma arrays for coincidence measurements

# Challenges

- *low beam intensity*
- *low beam purity/isobaric contaminants*
- *poor energy resolution & emittance*
- *limited species*
- *kinematic compression*
- *limited beamtime*

## Challenges – Low Intensity

- careful choice of reaction channel
- design experiments with lower-than-expected beam intensities

# Challenges – Low Intensity

- *high efficiency detection schemes*
- *large acceptance detection schemes*

Nuclear Ast

# Challenges – Low Intensity

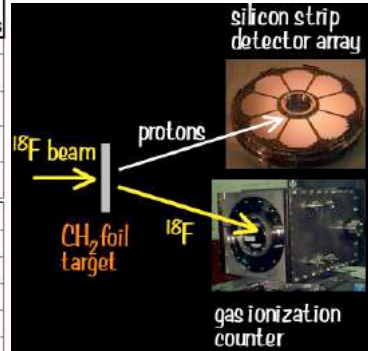

- maximize signal – to – noise by closely connecting preamps to Si strip detectors

## Challenges – Low Intensity

- thick target yields to measure entire excitation functions at once

# Challenges – Low Purity

- Nearly background-free yields
- Use of impure beams possible
- measure low cross section reactions with **impure** radioactive beams

- coincidence measurements

## Challenges – Low Purity

- ranging out techniques use gas volumes to selectively filter out contaminant isotopes based on different energy losses

# Challenges – Poor Emittance

- *beam particle tracking*

## Challenges – Kinematic Compression

- use detectors with higher pixellation (lower  $d\theta$ )
- use thinner targets (lower  $dE$ )
- careful choice of beam energies

## Challenges – Limited Species

- use multiple reaction channels
- run as many experiments per beam as possible

## Challenges – Limited Beamtime

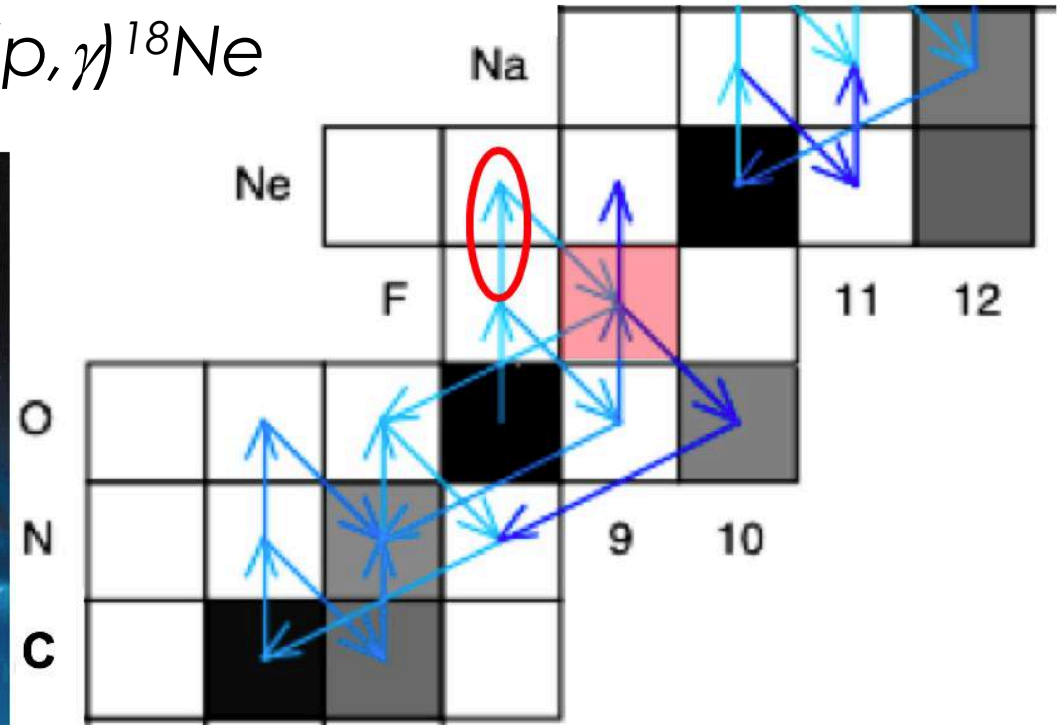

sliding  
rail mount

rail

- *assume detector configurations may change between runs*
- *use rail mounting systems for quick changes without alignments*

## Direct Measurement of $^{17}\text{F}(p, \gamma)^{18}\text{Ne}$

- reaction important for synthesizing  $^{18}\text{F}$  in novae – possible observable
- we used a recoil separator to make the first and only direct measurement of  $^{17}\text{F}(p, \gamma)^{18}\text{Ne}$

## Direct Measurement of $^{17}\text{F}(p, \gamma)^{18}\text{Ne}$

FIG. 4. (Color online) Energy loss versus total energy from the ionization chamber for the 557 keV resonance in  $^{17}\text{O}(p, \gamma)^{18}\text{F}$ .

- measured  $^{17}\text{O} + p$  capture to calibrate system & method

## Direct Measurement of $^{17}\text{F}(p,\gamma)^{18}\text{Ne}$

FIG. 5. (Color online) Ionization chamber spectrum for the  $^{17}\text{O} + ^{20}\text{Ne}$  scattering measurement with Ne recoils indicated; performed to verify the location of  $^{18}\text{Ne}$  recoils during the  $^{17}\text{F}(p,\gamma)^{18}\text{Ne}$  experiment.

- measured  $^{17}\text{O} + ^{20}\text{Ne}$  capture to show where Ne recoils should be

# Direct Measurement of $^{17}\text{F}(p, \gamma)^{18}\text{Ne}$

- measured  $^{17}\text{F} + p$  capture on resonance !

# Direct Measurement of $^{17}\text{F}(p, \gamma)^{18}\text{Ne}$

- measured  $^{17}\text{F} + p$  capture on resonance !

# Direct Measurement of $^{17}\text{F}(p, \gamma)^{18}\text{Ne}$

- implications for novae:
  - new fusion rate 2 - 3 times lower
  - in novae, new rate **increases** synthesis of  $^{18}\text{F}$  by factor of 1.6 in some models, reduces uncertainties from factor of 15 to factor of  $\sim 2.5$
  - more  $^{18}\text{F}$  **survives** explosion  $\rightarrow$  volume scanned by billion dollar satellites increased by factor of 2
- implications for X-ray bursts: changes synthesis of  $^{17}\text{O}$  by factor of 10, and reduces uncertainties (factor of 100 to factor of  $\sim 5$ )

# Systematic Measurements of $(d,p)$ on exotic Sn isotopes

PHYSICAL REVIEW C **99**, 041302(R) (2019)

# Systematic Measurements of (d,p) on exotic Sn isotopes

- 630 MeV  $^{128}\text{Sn}$  beam (5 MeV/u) with > 99% purity
- Typical beam current  $1 - 3 \cdot 10^5$  pps ... 5 days data collection
- $139 \pm 17 \mu\text{g}/\text{cm}^2$  and  $242 \pm 39 \mu\text{g}/\text{cm}^2$   $\text{CD}_2$  targets

# Systematic Measurements of (d,p) on exotic Sn isotopes

B. Manning et al.

- measured (d,p) energy-angle kinematic relationship
- gating on heavy – light particle time coincidence greatly reduces background

# Systematic Measurements of (d,p) on exotic Sn isotopes

- Q-value spectra for (d,p) on Sn isotopes

# Systematic Measurements of (d,p) on exotic Sn isotopes

B. Manning et al.

- highly-segmented detector arrays facilitate angular distribution measurements
- fit with FR-ADWA theory using CH89 and KD potentials and angular momentum transfers of 3 (red) or 1 (blue)

- constrain spin-parity, determine spectroscopic factors from angular distributions
- best fits using DWBA and ADWA with different potentials
- used to **constrain neutron capture cross sections** in nuclei relevant for cold r-process models
- systematic info on single particle levels off stability provides **challenge for theorists**

# Future Plans

- commissioning SECAR with stable beams
- measurements with p-rich and n-rich beams at FRIB
- further development of new techniques (2-energy approaches) & detectors
- measurements at RAON 😊 and other facilities

# Summary

- measurements with radioactive beams have **tremendous potential** in nuclear astrophysics & other areas of nuclear science
- these measurements have many **special challenges** – low intensity, low purity, limited species, poorly defined energies ...
- some approaches to try include
  - planning measurements with very LOW beam intensities (well below projected intensities)
  - combining direct & indirect measurements for valuable, complementary information on reactions and nuclei of interest
  - measuring kinematically complete (coincidence) reactions, measure multiple reaction channels, and tracking beam particles
- wish you **great success** with RISP / RAON !
